

kinetic energy equation -

$$KE = \frac{1}{2} m \cdot v^2$$

ex: A shot-putter heaves a 7.2 kg shot with a velocity of 6.9 m/s.

a. What is the K.E. of the shot?

$$m = 7.2 \text{ kg}$$

$$v = 6.9 \text{ m/s}$$

$$KE = \frac{1}{2} m \cdot v^2$$

$$KE = \frac{1}{2} \cdot 7.2 \text{ kg} \cdot (6.9 \text{ m/s})^2 = 172 \text{ J}$$

b. How much work did the shot-putter do on the shot?

$$W = \Delta E = 172 \text{ J}$$

Problem Set #1: (1-3) on back

potential energy equation -

$$PE = m \cdot g \cdot h$$

Can you measure an object's potential energy?

No

Can you measure an object's change in PE?

Yes

ex: A 2.0 kg book is lifted from a table to a shelf 1.8 m above the floor. What is the gravitational potential energy of the book...

a. relative to the floor?

$$m = 2 \text{ kg}$$

$$h = 1.8 \text{ m}$$

$$PE = m \cdot g \cdot h = 2 \text{ kg} \cdot 9.8 \text{ m/s}^2 \cdot 1.8 \text{ m} = 35.28 \text{ J}$$

$$PE = 35 \text{ J}$$

b. relative to the table 0.6 m above the floor?

$$PE = m \cdot g \cdot h = 2 \text{ kg} \cdot 9.8 \text{ m/s}^2 \cdot 1.2 \text{ m} = 23.52 \text{ J}$$

$$PE = 11.76 \text{ J} \approx 12 \text{ J}$$

Problem Set #2 (1-2) on back

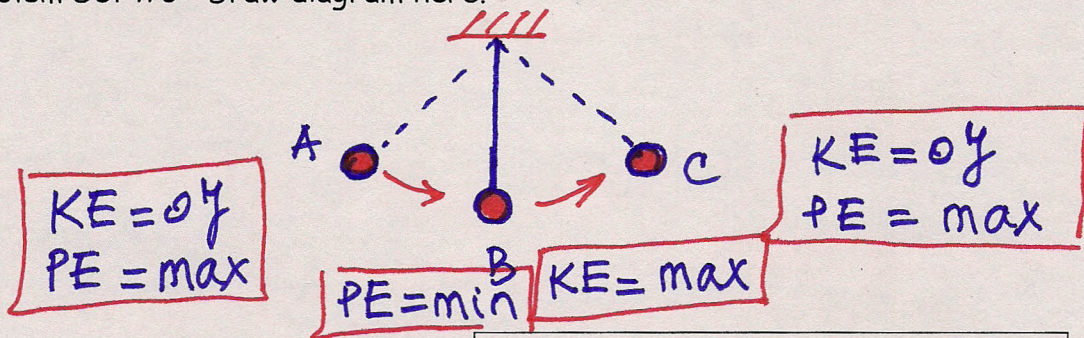

Energy can be transformed from potential to kinetic and vice versa.

Law of Conservation of Energy:

- Energy can change form but cannot be created or destroyed.
- In a closed, isolated system, the total mechanical energy (KE + PE) remains constant.

Momentum and Energy
(continued)

Problem Set #3: Draw diagram here.

Conservation of Energy equation:

$$KE_i + PE_i = KE_f + PE_f$$

Conservation Ex. Problem:

A 12 kg rock is at the edge of a 95 m cliff.

a. What is the rock's initial PE and KE?

$$PE = 12 \text{ kg} \cdot 9.8 \text{ m/s}^2 \cdot 95 \text{ m} = 11000 \text{ J}$$

$$KE = 0 \text{ J}$$

b. If the rock falls to the ground, what is its final PE and KE just before it hits?

$$PE_i + KE_i = PE_f + KE_f$$

$$KE_f = 11000 \text{ J}$$

c. What is the rock's velocity just before it hits the ground?

$$KE = \frac{1}{2} m v^2$$

$$v = \sqrt{\frac{2KE}{m}} = 43 \text{ m/s}$$

Problem Set #4 (1-2) on back

During **elastic** collisions, KE is - **conserved** by the system of objects.

During **inelastic** collisions KE is - **not conserved** by the system because some energy is - **lost** to the surroundings as heat.

How are momentum ($p = m \cdot v$) and kinetic energy ($KE = \frac{1}{2} m \cdot v^2$):

- similar? mass "m" velocity "v"
- different?

momentum - p - is a vector Unit: $\text{kg} \cdot \text{m/s}$
 kinetic energy - KE - is a scalar Unit: Joule

A change in momentum is creating an impulse $\Delta m \cdot v = F \cdot \Delta t$
 A change of the energy of the system is equal with the amount of work done by or on the system.

$$\Delta E = W$$
